Quantum Theory: A Very Short Introduction. John Polkinghorne has produced an excellent piece of work. . . . Many authors of popular books on modern physics have the regrettable habit of mixing science fact with science fiction. Polkinghorne never does that: he always allows the truth to stand by itself and show its own fascination.

And yet the theory is amazingly accurate and widely applied, explaining all of chemistry and most of physics. "Introducing Quantum Theory" takes us on a step-by-step tour with the key figures, including Planck, Einstein, Bohr, Heisenberg and Schrodinger. Each contributed at least one crucial concept to the theory.

The basics of quantum mechanics terms of the radius of the orbit: $|L| = \hbar \sqrt{l(l+1)}$, $E = -\frac{Z^2 e^2}{2a_0 n^2}$. (1.6)
The energy characterizing an orbit of radius r , relative to the $E = 0$ reference of energy at $r \rightarrow \infty$, becomes more and more negative (i.e., lower and lower) as r becomes smaller.

deal with relativistic field theories. A central role in these lectures is played by the path integral representation of quantum field theory, which we will derive and use for both bosonic and for fermionic fields. Another topic is the use of diagrammatic representations of the path integral.

The title of the book is misleading. It should be called "Introducing the History of Quantum Theory: A Guide". It does very little in explaining Quantum Theory, but it does a pretty good job at explaining who came up with it. The "graphic" part is almost entirely superfluous, but does have some nice cartoon drawings of people like Rutherford.
